### 1.1 Derivatives and Differentials (Part 1)

**Definition.** Let  $f : \mathbb{R}^n \rightarrow \mathbb{R}$ . We define the **partial derivative** of  $f$  at  $\underline{x} = (x_1, \dots, x_n)$  with respect to  $x_j$  by

$$\frac{\partial f(\underline{x})}{\partial x_j} = \lim_{h \rightarrow 0} \frac{f(x_1, \dots, x_{j-1}, x_j + h, x_{j+1}, \dots, x_n) - f(x_1, \dots, x_{j-1}, x_j, x_{j+1}, \dots, x_n)}{h}.$$

**Note.** (a)  $\frac{\partial f(\underline{x})}{\partial x_j}$  is also denoted by  $D_j f$  and by  $f_{x_j}$ . (x<sub>1</sub>, ..., x<sub>n</sub>)

(b) In terms of the standard basis:

$$\begin{pmatrix} x_1 \\ \vdots \\ x_j + h \\ \vdots \\ x_n \end{pmatrix} = \underline{x} + h \underline{e}_j$$

$$\underline{e}_j = \begin{pmatrix} 0 \\ \vdots \\ 1 \\ \vdots \\ 0 \end{pmatrix} \leftarrow j\text{-th row}$$

$$\frac{\partial f(\underline{x})}{\partial x_j} = \lim_{h \rightarrow 0} \frac{f(\underline{x} + h \underline{e}_j) - f(\underline{x})}{h}.$$

**Example.** (a) Let  $f(x_1, x_2, x_3) = x_3 \ln(x_1^2 + x_2^2)$ . Then

$$\frac{\partial f(\underline{x})}{\partial x_1} = x_3 \frac{\partial}{\partial x_1} \ln(x_1^2 + x_2^2) = x_3 \frac{1}{x_1^2 + x_2^2} \frac{\partial}{\partial x_1} (x_1^2 + x_2^2) = \frac{x_3}{x_1^2 + x_2^2} \cdot 2x_1$$

$(x_2, x_3 \text{ constants})$

$$\frac{\partial f(\underline{x})}{\partial x_2} = x_3 \cdot \frac{1}{x_1^2 + x_2^2} 2x_2$$

$(x_1, x_3 \text{ constants})$

$$\frac{\partial f(\underline{x})}{\partial x_3} = 1 \cdot \underbrace{\ln(x_1^2 + x_2^2)}_{\text{constant}}$$

$(x_1, x_2 \text{ constant})$

(b) Let  $f(u, v) = ue^{2v}$ . Find  $\left. \frac{\partial f}{\partial u} \right|_{(2,3)}$  and  $\left. \frac{\partial f}{\partial v} \right|_{(2,3)}$ .

$$\underbrace{\frac{\partial f}{\partial u}}_{(2,3)} \quad \frac{\partial f}{\partial v}_{(2,3)}$$

$$\frac{\partial f}{\partial u} = 1 \cdot e^{2v} = e^{2v}$$

$$\left. \frac{\partial f}{\partial u} \right|_{(u,v)=(2,3)} = e^6$$

$$\frac{\partial f}{\partial v} = u(2e^{2v}) = 2ue^{2v}$$

$$\left. \frac{\partial f}{\partial v} \right|_{(u,v)=(2,3)} = 4e^6.$$

**Note.** The following rules for derivatives hold for partial derivatives.

$$(a) \frac{\partial(\alpha f + \beta g)}{\partial x_j} = \alpha \frac{\partial f}{\partial x_j} + \beta \frac{\partial g}{\partial x_j}, \quad \alpha, \beta \in \mathbb{R}, \quad f, g : \mathbb{R}^n \rightarrow \mathbb{R}.$$

*constant*

(linearity)

$$(b) \frac{\partial(fg)}{\partial x_j} = f \frac{\partial g}{\partial x_j} + g \frac{\partial f}{\partial x_j}, \quad f, g : \mathbb{R}^n \rightarrow \mathbb{R}.$$

(product rule)

# MULTIVARIABLE CALCULUS

## MATH2007

### 1.1 Derivatives and Differentials (Part 2)

**Definition.** Let  $\underline{F} : \mathbb{R}^n \rightarrow \mathbb{R}^m$ , we define  $\underline{F}'(\underline{x})$  the matrix **derivative** of  $\underline{F}$  at  $\underline{x}$  by

$n$ -variables

$$\underline{F}' = \left[ \begin{array}{ccc} \frac{\partial F_1}{\partial x_1} & \cdots & \frac{\partial F_1}{\partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial F_m}{\partial x_1} & \cdots & \frac{\partial F_m}{\partial x_n} \end{array} \right]$$

$m$  rows

$n$  columns

$m \times n$  matrix

$$\underline{F}(\underline{x}) = \begin{pmatrix} F_1(\underline{x}) \\ F_2(\underline{x}) \\ \vdots \\ F_m(\underline{x}) \end{pmatrix}$$

**Example.** (a) Let  $\underline{F}(x_1, x_2, x_3) = \begin{pmatrix} F_1 \\ F_2 \end{pmatrix} = \begin{pmatrix} (x_1^2 + x_2^2) \cos x_3 \\ (x_1^2 + x_2^2) \sin x_3 \end{pmatrix}$ .

$$\underline{F} : \mathbb{R}^3 \rightarrow \mathbb{R}^2$$

$\underline{F}'(x_1, x_2, x_3)$  is a  $2 \times 3$  matrix.

$$\underline{F}'(x_1, x_2, x_3) = \begin{pmatrix} \frac{\partial F_1}{\partial x_1} & \frac{\partial F_1}{\partial x_2} & \frac{\partial F_1}{\partial x_3} \\ \frac{\partial F_2}{\partial x_1} & \frac{\partial F_2}{\partial x_2} & \frac{\partial F_2}{\partial x_3} \end{pmatrix}$$

$$= \begin{pmatrix} 2x_1 \cos x_3 & 2x_2 \cos x_3 & -(x_1^2 + x_2^2) \sin x_3 \\ 2x_1 \sin x_3 & 2x_2 \sin x_3 & (x_1^2 + x_2^2) \cos x_3 \end{pmatrix}.$$

(b) Let  $\phi(x_1, x_2) = x_1 e^{-x_2}$ . Find  $\phi'(2, 3)$ .

$$\phi: \mathbb{R}^2 \rightarrow \mathbb{R}^1$$

$\phi'(x_1, x_2)$  is a  $1 \times 2$  matrix.

$$\begin{aligned}\phi'(x_1, x_2) &= \left( \frac{\partial \phi}{\partial x_1} \quad \frac{\partial \phi}{\partial x_2} \right) \\ &= (e^{-x_2} \quad -x_1 e^{-x_2})\end{aligned}$$

$$\phi'(2, 3) = \phi'(x_1=2, x_2=3) = (e^{-3} \quad -2e^{-3}).$$

(c) Let

$$\underline{r}(t) = \begin{pmatrix} r_1 \\ r_2 \end{pmatrix} = \begin{pmatrix} e^t \cos t \\ e^t \sin t \end{pmatrix}$$

$$\Gamma: \mathbb{R}^1 \rightarrow \mathbb{R}^2$$
$$\Gamma'(t) = \begin{pmatrix} \frac{\partial r_1}{\partial t} \\ \frac{\partial r_2}{\partial t} \end{pmatrix}$$

$$= \begin{pmatrix} e^t \cos t - e^t \sin t \\ e^t \sin t + e^t \cos t \end{pmatrix} \cdot$$

**Note.**

- (i) If  $\underline{r}(t)$  gives the position of a particle at time  $t$ , then  $\underline{r}'(t)$  is the velocity at time  $t$  and  $\underline{r}''(t) = (\underline{r}'(t))'$  is the acceleration at time  $t$ .
- (ii)  $\underline{r}'(t)$  is a vector tangent to the curve traced out by  $\underline{r}(t)$ ,  $t \in \mathbb{R}$ , at the point  $\underline{r}(t)$ .

**Example.** (a) Consider the curve  $y = x^2$  in  $\mathbb{R}^2$ , this can be parametrized (written in parametric form) by

$$\underline{r}(t) = \begin{pmatrix} r_1 \\ r_2 \end{pmatrix} = \begin{pmatrix} t \\ t^2 \end{pmatrix} \quad \begin{matrix} x = t \\ y = t^2 \end{matrix}$$

Illustrate  $\underline{r}'(t)$ .

$$\underline{r}'(t) = \begin{pmatrix} 1 \\ 2t \end{pmatrix} \quad \left. \begin{matrix} x \text{ change} \\ y \text{ change} \end{matrix} \right\} \text{ for slope}$$

$$y = x^2 \quad \frac{dy}{dx} = 2x$$

(b) Consider the circle centre  $(0, 0)$  radius 2. This can be parametrized by

$$\underline{r}(t) = \begin{pmatrix} 2 \cos t \\ 2 \sin t \end{pmatrix} \begin{matrix} x \\ y \end{matrix} \quad t \in [0, 2\pi] \quad \text{i.e.} \quad x = r \cos \theta, \quad y = r \sin \theta.$$

Find the tangent line to this circle at  $\begin{pmatrix} 1 \\ \sqrt{3} \end{pmatrix} = \begin{pmatrix} 2 \cos t_0 \\ 2 \sin t_0 \end{pmatrix} = \underline{r}(t_0) \Rightarrow t_0 = \frac{\pi}{3}$

tangent line:  $\underline{r}(t_0) + t \underline{r}'(t_0)$

$$\underline{r}'(t) = \begin{pmatrix} -2 \sin t \\ 2 \cos t \end{pmatrix} \quad \underline{r}'\left(\frac{\pi}{3}\right) = \begin{pmatrix} -\sqrt{3} \\ 1 \end{pmatrix}$$

equation for the tangent line:

$$\begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} 1 \\ \sqrt{3} \end{pmatrix} + t \begin{pmatrix} -\sqrt{3} \\ 1 \end{pmatrix} = \begin{pmatrix} 1 - t\sqrt{3} \\ \sqrt{3} + t \end{pmatrix}$$

$$y = \dots$$

# MULTIVARIABLE CALCULUS

## MATH2007

### 1.1 Derivatives and Differentials (Part 3)

**Definition.** Let  $\underline{F} : \mathbb{R}^n \rightarrow \mathbb{R}^m$  and  $\underline{a} \in \mathbb{R}^n$ . We define the **differential** of  $\underline{F}$  at  $\underline{a}$  to be the linear map given by

$$d\underline{F}(\underline{a}; \underline{h}) = \underline{F}'(\underline{a})\underline{h}$$

(where  $\underline{a}$  is the point of evaluation and  $\underline{h}$  is a small change).

**Note.** For small  $\underline{h} \in \mathbb{R}^n$  we have

$$\underline{F}(\underline{a} + \underline{h}) \cong \underline{F}(\underline{a}) + d\underline{F}(\underline{a}; \underline{h}) = \underline{F}(\underline{a}) + \underline{F}'(\underline{a})\underline{h}.$$

$$f(a+h) \cong f(a) + \underbrace{h f'(a)}_{df(a;h)}$$

(i.e a small change in the domain  $\underline{h}$  gives a small change in the range  $\underline{F}'(\underline{a})\underline{h}$ ).

linear: (in  $\underline{h}$ ) for all constants  $\alpha, \beta \in \mathbb{R}$ , and  $\underline{h}_1, \underline{h}_2 \in \mathbb{R}^n$

$$d\underline{F}(\underline{a}, \alpha \underline{h}_1 + \beta \underline{h}_2) = \alpha d\underline{F}(\underline{a}, \underline{h}_1) + \beta d\underline{F}(\underline{a}, \underline{h}_2)$$

**Note.** If  $\underline{u}$  and  $\underline{v}$  are column vectors in  $\mathbb{R}^n$ , i.e

$$\underline{u} = \begin{pmatrix} u_1 \\ \vdots \\ u_n \end{pmatrix} \text{ and } \underline{v} = \begin{pmatrix} v_1 \\ \vdots \\ v_n \end{pmatrix}$$

then

$$\underline{u} \cdot \underline{v} = \sum_{i=1}^n u_i v_i = \underline{u}^T \underline{v}.$$

If  $\underline{u} \cdot \underline{v} \in \mathbb{C}^n$  then  $\underline{u} \cdot \underline{v} = \underline{u}^T \overline{\underline{v}}$  but for  $\underline{v} \in \mathbb{R}^n$  we have  $\underline{v} = \overline{\underline{v}}$ .

**Theorem.** Let  $\underline{F}, \underline{G} : \mathbb{R}^n \rightarrow \mathbb{R}^m$  and  $g : \mathbb{R}^n \rightarrow \mathbb{R}$ , i.e.

$$\underline{F}(x_1, \dots, x_n) = \begin{pmatrix} F_1 \\ \vdots \\ F_m \end{pmatrix} \quad \text{and} \quad \underline{G}(x_1, \dots, x_n) = \begin{pmatrix} G_1 \\ \vdots \\ G_m \end{pmatrix},$$

then:  $\underline{F}(\underline{x}) \cdot \underline{G}(\underline{x})$

(a)  $(\underline{F} \cdot \underline{G})' = \underline{F}^T \underline{G}' + \underline{G}^T \underline{F}';$   
 $1 \times n \quad 1 \times m \quad m \times n \quad 1 \times m \quad m \times n$

(b)  $(\alpha \underline{F} + \beta \underline{G})' = \alpha \underline{F}' + \beta \underline{G}'$  for all  $\alpha, \beta \in \mathbb{R}$ ;  
 $m \times n \quad m \times n \quad m \times n \quad 1 \times n$

(c)  $(g \underline{F})' = g \underline{F}' + \underline{F} g'.$   
 $m \times n \quad m \times n \quad m \times 1 \quad 1 \times n$

(product rule  $\rightarrow$  [vector-vector])

(linearity)

(product rule  $\rightarrow$  [scalar-vector])

$g(\underline{x}) \underline{F}(\underline{x})$

$g \underline{F} : \mathbb{R}^n \rightarrow \mathbb{R}^m$

Proof of (a).

order is important

□

$\underline{F} \cdot \underline{G} : \mathbb{R}^n \rightarrow \mathbb{R}$

$\underline{F}(\underline{x}) \cdot \underline{G}(\underline{x}) = \sum_{j=1}^m F_j(\underline{x}) G_j(\underline{x})$

$$\frac{\partial}{\partial x_k} \underline{F} \cdot \underline{G} = \sum_{j=1}^m \frac{\partial}{\partial x_k} F_j \cdot G_j = \sum_{j=1}^m \left( G_j \frac{\partial F_j}{\partial x_k} + F_j \frac{\partial G_j}{\partial x_k} \right) = \sum_{j=1}^m G_j \frac{\partial F_j}{\partial x_k} + \sum_{j=1}^m F_j \frac{\partial G_j}{\partial x_k}$$

$$\begin{aligned}
 (\underline{F} \cdot \underline{G})' &= \left( \frac{\partial}{\partial x_1} \underline{F} \cdot \underline{G} \quad \dots \quad \frac{\partial}{\partial x_n} \underline{F} \cdot \underline{G} \right) \\
 &= \left( \sum_{j=1}^m G_j \frac{\partial F_j}{\partial x_1} + \sum_{j=1}^m F_j \frac{\partial G_j}{\partial x_1} \quad \dots \quad \sum_{j=1}^m G_j \frac{\partial F_j}{\partial x_n} + \sum_{j=1}^m F_j \frac{\partial G_j}{\partial x_n} \right) \\
 &= \underbrace{\left( \sum_{j=1}^m G_j \frac{\partial F_j}{\partial x_1} \quad \dots \quad \sum_{j=1}^m G_j \frac{\partial F_j}{\partial x_n} \right)}_{\underline{G}^T \cdot \underline{F}'} + \underbrace{\left( \sum_{j=1}^m F_j \frac{\partial G_j}{\partial x_1} \quad \dots \quad \sum_{j=1}^m F_j \frac{\partial G_j}{\partial x_n} \right)}_{\underline{F}^T \cdot \underline{G}'}
 \end{aligned}$$

$$\underline{G}^T \cdot \underline{F}' = (G_1 \quad \dots \quad G_m) \begin{pmatrix} \frac{\partial F_1}{\partial x_1} & \dots & \frac{\partial F_1}{\partial x_n} \\ \vdots & & \vdots \\ \frac{\partial F_m}{\partial x_1} & \dots & \frac{\partial F_m}{\partial x_n} \end{pmatrix} = \left( \sum_{j=1}^m G_j \frac{\partial F_j}{\partial x_1} \quad \dots \quad \sum_{j=1}^m G_j \frac{\partial F_j}{\partial x_n} \right)$$

Thus  $(\underline{F} \cdot \underline{G})' = \underline{G}^T \cdot \underline{F}' + \underline{F}^T \cdot \underline{G}'$ .

**Example.** (a) Let  $\underline{T}(u, v) = e^{-u+v} \begin{pmatrix} uv \\ u^2 + v^2 \end{pmatrix}$ . Find  $\underline{T}'$  using part (c) with  $g = e^{-u+v}$  and

$$\underline{F} = \begin{pmatrix} uv \\ u^2 + v^2 \end{pmatrix}.$$

$$\underline{T}(u, v) = \begin{pmatrix} e^{-u+v} uv \\ e^{-u+v} (u^2 + v^2) \end{pmatrix}$$

$$\underline{T}'(u, v) = g \underline{F}' + \underline{F} g'$$

$$= e^{-u+v} \begin{pmatrix} v & u \\ 2u & 2v \end{pmatrix} + \begin{pmatrix} uv \\ u^2 + v^2 \end{pmatrix} \begin{pmatrix} -e^{-u+v} & e^{-u+v} \end{pmatrix}$$

$$= \begin{pmatrix} e^{-u+v} v & e^{-u+v} u \\ 2e^{-u+v} u & 2e^{-u+v} v \end{pmatrix} + \begin{pmatrix} -e^{-u+v} uv & e^{-u+v} uv \\ -e^{-u+v} (u^2 + v^2) & e^{-u+v} (u^2 + v^2) \end{pmatrix}$$

$$= e^{-u+v} \begin{pmatrix} v - uv & u + uv \\ 2u - u^2 - v^2 & 2v + u^2 + v^2 \end{pmatrix}.$$

(b) If  $\|\underline{F}\|$  is constant, show that  $(\underline{F}')^T \underline{F} = \underline{0}$ .

$$\|\underline{F}\| = c \quad (c \text{ a constant})$$

$$\therefore \sqrt{\underline{F} \bullet \underline{F}} = c \quad \therefore \underline{F} \bullet \underline{F} = c^2 \quad (\text{for all } x)$$

$$\therefore (\underline{F} \bullet \underline{F})' = \underline{0}$$

$$\text{Thm (a)} \quad \underline{F} = \underline{G}$$

$$\therefore \overset{\underline{G}'}{\underline{F}^T} \underline{F}' + \overset{\underline{G}^T}{\underline{F}^T} \underline{F}' = \underline{0}$$

$$(\text{by Thm (a)})$$

$$\therefore 2 \underline{F}^T \underline{F}' = \underline{0}$$

$$\therefore \underline{F}^T \underline{F}' = \underline{0}$$

$$\therefore (\underline{F}^T \underline{F}')^T = \underline{0}$$

$$\therefore (\underline{F}')^T \underline{F} = \underline{0}$$

$$(\underline{AB})^T = \underline{B}^T \underline{A}^T$$

$$(\underline{A}^T)^T = \underline{A}$$

# MULTIVARIABLE CALCULUS

## MATH2007

### 1.1 Derivatives and Differentials (Part 4)

**Theorem.** Let  $\underline{r}, \underline{s} : \mathbb{R} \rightarrow \mathbb{R}^3$  i.e.

$$\left[ \underline{r}(t) = \begin{pmatrix} r_1(t) \\ r_2(t) \\ r_3(t) \end{pmatrix} \text{ and } \underline{s}(t) = \begin{pmatrix} s_1(t) \\ s_2(t) \\ s_3(t) \end{pmatrix} \right]$$

then

$$(a) \ (\underline{r} \cdot \underline{s})' = \underline{r} \cdot \underline{s}' + \underline{r}' \cdot \underline{s}$$

$$(b) \ (\underline{r} \times \underline{s})' = \underline{r}' \times \underline{s} + \underline{r} \times \underline{s}'.$$

*Proof.*

↑  
order matters

□

$$\begin{aligned} (a) \ (\underline{r} \cdot \underline{s})' &= \underline{r}^T \underline{s}' + \underline{s}^T \underline{r}' \\ &= \underline{r} \cdot \underline{s}' + \underline{s} \cdot \underline{r}' \\ &= \underline{r} \cdot \underline{s}' + \underline{r}' \cdot \underline{s} \end{aligned}$$

(by Thm 1.1.4(a))

(property of  $\cdot$ )

(commutativity of  $\cdot$ )

$$b) \quad \underline{r} \times \underline{s} = \begin{pmatrix} r_2 s_3 - s_2 r_3 \\ r_3 s_1 - s_3 r_1 \\ r_1 s_2 - s_1 r_2 \end{pmatrix}$$

$$(\underline{r} \times \underline{s})' = \begin{pmatrix} r_2' s_3 + r_2 s_3' - s_2' r_3 - s_2 r_3' \\ r_3' s_1 + r_3 s_1' - s_3' r_1 - s_3 r_1' \\ r_1' s_2 + r_1 s_2' - s_1' r_2 - s_1 r_2' \end{pmatrix} \quad (\text{product rule})$$

$$= \underline{r}' \times \underline{s} + \underline{r} \times \underline{s}'$$

$$\underline{r}' = \begin{pmatrix} r_1' \\ r_2' \\ r_3' \end{pmatrix} \quad \underline{s}' = \begin{pmatrix} s_1' \\ s_2' \\ s_3' \end{pmatrix}$$

$$r_i' = \frac{\partial r_i}{\partial t} = \frac{dr_i}{dt}$$

**Example.** (a) If  $\underline{r}$  has constant length, show that the vector  $\underline{r}(t)$  is orthogonal to the path traced out by  $\underline{r}(t)$ ,  $t \in \mathbb{R}$ .

$$\|\underline{r}\| = c \quad (c \text{ a constant})$$

$$\underline{r}(t) \cdot \underline{r}(t) = c^2 \quad \text{for all } t \in \mathbb{R}$$

$$(\underline{r}(t) \cdot \underline{r}(t))' = 0$$

$$2 \underline{r}(t) \cdot \underline{r}'(t) = 0 \quad (\text{by Thm (a)})$$

$$\therefore \underline{r}(t) \cdot \underline{r}'(t) = 0$$

$\therefore \underline{r}(t)$  is orthogonal to the tangent at  $\underline{r}(t)$ ;  
i.e. to the path traced out by  $\underline{r}(t)$ .

(b) Consider the parallelopiped with sides spanned by  $\underline{p}(t)$ ,  $\underline{q}(t)$ ,  $\underline{r}(t)$ . The volume of this solid is  $|\underline{p}(t) \cdot (\underline{q}(t) \times \underline{r}(t))|$ . Let

scalar

$$\underline{p} = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \quad \underline{q} = \begin{pmatrix} 0 \\ t \\ 1 \end{pmatrix}, \quad \underline{r} = \begin{pmatrix} 0 \\ 2 \\ f(t) \end{pmatrix}.$$

Find the rate of change of this volume as a function of time and hence find a condition for a local max or min in volume at  $t_0$ .

$$g(t) = \underline{p}(t) \cdot (\underline{q}(t) \times \underline{r}(t)) = \begin{vmatrix} 1 & 0 & 0 \\ 0 & t & 1 \\ 0 & 2 & f(t) \end{vmatrix}$$

$$= tf(t) - 2$$

$$g'(t) = f(t) + tf'(t).$$

using dot and cross product rules:

$$g'(t) = (\underline{p}(t) \cdot (\underline{q}(t) \times \underline{r}(t)))' = \cancel{\underline{p}' \cdot (\underline{q}(t) \times \underline{r}(t))} + \underline{p} \cdot (\underline{q}(t) \times \underline{r}(t))' \quad \text{0 since } \underline{p}' = \underline{0}$$

$$g'(t) = (p(t) \cdot (q(t) \times r(t)))' = \overset{0}{p'} \cdot (q(t) \times r(t)) + p \cdot (q(t) \times r(t))'$$

$$= p \cdot (q'(t) \times r(t) + q(t) \times r'(t))$$

$$= \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \cdot \left[ \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \times \begin{pmatrix} 0 \\ 2 \\ f(t) \end{pmatrix} + \begin{pmatrix} 0 \\ t \\ 1 \end{pmatrix} \times \begin{pmatrix} 0 \\ 0 \\ f'(t) \end{pmatrix} \right]$$

$$= f(t) + t f'(t).$$

$$\text{Max/Min if } f(t) + t f'(t) = 0$$
